The puzzle I spent the most time designing would be the pillar puzzle in level two. I did spend the most time learning how to use Godot and actually make the assets and nodes in the first level, but design was the trickiest was level two. I started off with an initial sketch of what I wanted the map to look like. This would give me a feel for how I could place buttons and pillars as well as where the blocks would be, allowing me to create a trickier puzzle. Initially my sketch only had buttons rather than timed levers. Once I had the map drawn out, I was able to think about it and see how I could make an effective map that really utilizes the order of the buttons and create a flow almost to the level, rather than a player being able to do things at any order they would like. The addition of timed levers is my favorite part of level two, I think it adds an extra challenge that can put pressure on the players, while also making the level feel different and more interactive than level one. Once I had these ideas I actually made a second final sketch before I would create the tilemap. I changed around the map a little adding in timed levers and a flow of puzzles that satisfied me. I drew little lines depicting how levers and buttons would interact with spikes around the map which became very beneficial when I was creating the map on Godot.

Creating the map was not too difficult, but my biggest accomplishment during the creation of this puzzle was figuring out how “RayCasts” work and how I could use them to fix the pillar collision issues I was having before. Implementing Raycasts allowed me to push pillars without them going through walls. It also fixed the issue of pillars getting stuck to random tiles on the floor and being unable to be pushed around the whole map. Some feedback that I implemented from my peers was to scale down the size of hallways and rooms, I think I successfully did that compared to the first level. I think that the proportion of puzzle to room is a lot more improved as opposed to what it was. Another piece of feedback I got was to implement a “reset button” that would allows users to click it incase the pillar gets stuck on a wall. This would come in useful later in level two, when I have spikes on timers that could cause players to become trapped. This allowed for them to simply restart the level and try again as opposed to trying to find a way to prevent this.
